Introductory Machine Learning

Reinforcement Learning

(continued)

December 1

Yale

Goings on

- Assignment 5 in today
- Assignment 6 out today (neural nets and RL)
- Quiz 6: Next Tuesday, December 6 (neural nets, RL, ethics)
- Tuesday: Panel discussion on societal issues in ML!
- Final exam, Dec 19 at 7pm (cumulative, 2.5 hours, cheat sheet, practice exam)

Recall from first week

Evaluation

- Six assignments (50%)
- Mid-semester exam (20%)
- Six quizzes (10%)
- Final exam: 20%

Lowest assignment score will be dropped. Late assignments not accepted.

42

Outline

- Quick recap
  - *Q*-learning
  - Illustration on taxi problem
  - RL concepts
- Deep reinforcement learning
- Learning to play Atari games
- Neuroscience connection

Main reference: “Reinforcement Learning: An Introduction” (Second Edition), Richard S. Sutton and Andrew G. Barto

Reinforcement learning

- An agent interacts with an environment
- The actions the agent takes change the state of the environment
- The agent receives rewards for each action, and seeks to maximize the total cumulative reward

Reinforcement learning is a framework for sequential decision making to achieve a long-term goal.

Reinforcement learning: Formalization

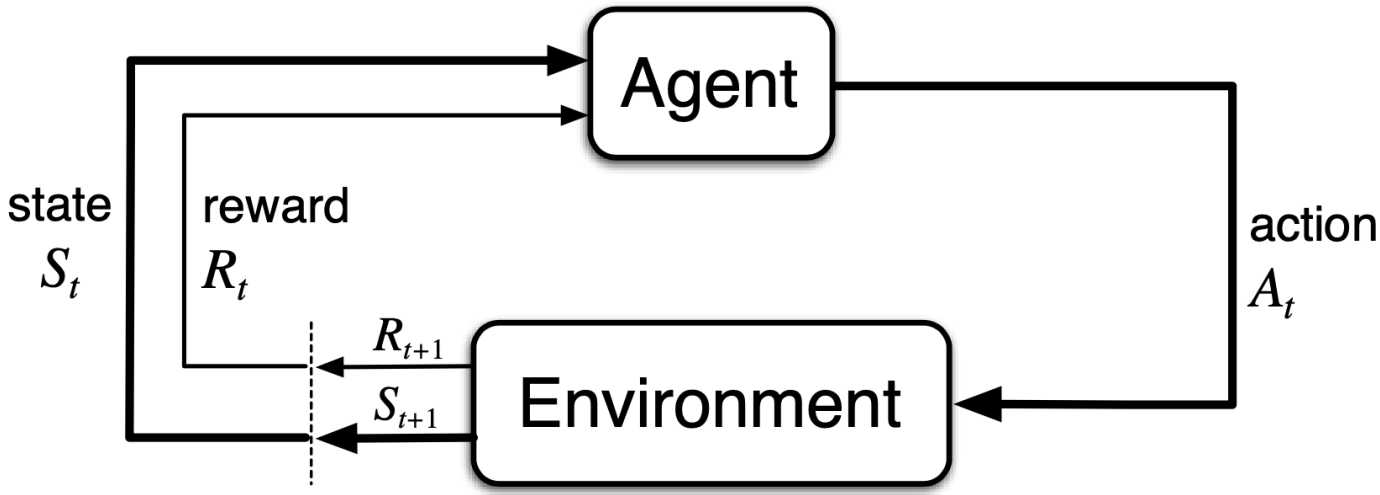
- The environment is in state s at a given time
- The agent takes action a
- The environment transitions to state $s' = \text{next}(s, a)$
- The agent receives reward $r = \text{reward}(s, a)$

Reinforcement learning: Formalization

- The environment is in state s at a given time
- The agent takes action a
- The environment transitions to state $s' = \text{next}(s, a)$
- The agent receives reward $r = \text{reward}(s, a)$

This is said to be a *Markov decision process*. It's "Markov" because the next state only depends on the current state and the action selected. It's a "decision process" because the agent is making choices of actions in a sequential manner.

RL setup



"Reinforcement Learning: An Introduction" (Second Edition), Richard S. Sutton and Andrew G. Barto

Recall: Taxi problem

A taxicab drives around the environment, picking up and delivering a passenger at four locations

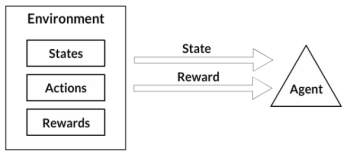
Reinforcement Learning

In reinforcement learning, an agent interacts with the environment, experiencing a series of rewards based on its actions. The agent seeks to maximize its rewards by developing a strategy that learns to choose appropriate actions in each state.

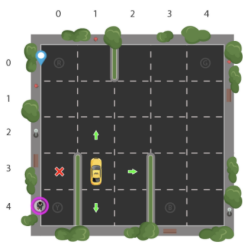


In this notebook we demo the Q-learning algorithm, one of the fundamental algorithms of reinforcement learning. We illustrate Q-learning on the taxicab problem formulated by Tom Dietterich in the paper "Hierarchical Reinforcement Learning with the MAXQ Value Function Decomposition", as developed in the code from OpenAI gym. Our presentation follows this tutorial.

We'll need the OpenAI gym package. This can be installed as shown below. We'll display some simple graphics using `IPython.display`.

```
[ ]  #!pip install gym
     import gym
     import numpy as np
     from IPython.display import clear_output
     from time import sleep
```

The environment is a simple grid, with some barriers inserted to make things more interesting. A taxicab drives around the environment, picking up and delivering a passenger at four locations. A graphic of the environment is shown below.



Q-learning update

Update:

$$Q(s,a) \longleftarrow$$

$$Q(s,a) + \alpha\Big(\text{reward}(s,a) + \gamma \max_{a'} Q(\text{next}(s,a),a') - Q(s,a)\Big)$$

Q-learning update

Update:

$$Q(s,a) \longleftarrow$$
$$Q(s,a) + \alpha\Big(\text{reward}(s,a) + \gamma \max_{a'} Q(\text{next}(s,a),a') - Q(s,a)\Big)$$

- When action a is taken in state s, reward reward(s,a) is given
- Then, the algorithm moves to a new state next(s,a)

Q-learning update

Update:

$$Q(s,a) \longleftarrow$$
$$Q(s,a) + \alpha\Big(\text{reward}(s,a) + \gamma \max_{a'} Q(\text{next}(s,a), a') - Q(s,a)\Big)$$

- Cumulative future reward of this action is $\max_{a'} Q(\text{next}(s,a), a')$
- Future rewards discounted by factor $\gamma < 1$
- Trades off short-term against long-term rewards

Important RL concepts

Policy: A mapping from states to actions. An algorithm/rule to make decisions at each time step, designed to maximize the long term reward.

"Reinforcement Learning: An Introduction" (Second Edition), Richard S. Sutton and Andrew G. Barto

Important RL concepts

Value function: A mapping from states to total reward. The total reward the agent can expect to accumulate in the future, starting from that state.

Rewards are short term. Values are predictions of future rewards.

"Reinforcement Learning: An Introduction" (Second Edition), Richard S. Sutton and Andrew G. Barto

Bellman equation

The optimal value function is the largest expected discounted long term reward starting from that state.

---

https://en.wikipedia.org/wiki/Richard_E._Bellman

Bellman equation: Deterministic case

The optimality condition for the value function v_* is

$$v_*(s) = \max_a \Big\{ \text{reward}(s, a) + \gamma v_*(\text{next}(s, a)) \Big\}$$

Bellman equation: Deterministic case

The optimality condition for the Q-function is

$$Q_*(s,a) = \text{reward}(s,a) + \gamma \max_{a'} Q_*(\text{next}(s,a), a')$$

and then $v_*(s) = \max_{a'} Q_*(s,a')$

Q-learning update

Note how this makes sense in terms of the update rule:

$$Q(s,a) \longleftarrow Q(s,a) + \alpha\Big(\text{reward}(s,a) + \gamma \max_{a'} Q(\text{next}(s,a), a') - Q(s,a)\Big)$$

Bellman equation: Deterministic case

If we know Q_*, we know v_*:

Bellman equation: Deterministic case

If we know Q_*, we know v_*:

$$
\begin{aligned}
v_*(s) &= \max_a Q_*(s,a) \\
&= \max_a \left\{ \text{reward}(s,a) + \gamma \max_{a'} Q_*(\text{next}(s,a), a') \right\} \\
&= \max_a \left\{ \text{reward}(s,a) + \gamma v_*(\text{next}(s,a)) \right\}
\end{aligned}
$$

which is the Bellman equation

Random environments: Assn 6

- Problem 2: Frozen Lake (25 points)

Will help gain intuition for deterministic vs. random environments

Bellman equation: Random environments

The optimality condition for the value function v_* is

$$\begin{aligned} v_*(s) &= \max_a \sum_{s',r} p(s', r \mid s, a)\Big\{r + \gamma v_*(s')\Big\} \\ &= \max_a \mathbb{E}\Big[R_{t+1} + \gamma v_*(S_{t+1}) \mid S_t = s, A_t = a\Big] \end{aligned}$$

Bellman equation: Random environments

Value function optimality

$$v_*(s) = \max_a \mathbb{E}\Big[R_{t+1} + \gamma v_*(S_{t+1}) \mid S_t = s, A_t = a\Big]$$

Bellman equation: Random environments

The optimality condition for the Q-function

$$
\begin{aligned}
Q_*(s,a) &= \sum_{s',r} p(s',r \mid s,a)\Big\{ r + \gamma \max_{a'} Q_*(s',a') \Big\} \\
&= \mathbb{E}\Big[R_{t+1} + \gamma \max_{a'} Q_*(S_{t+1},a') \;\mid\; S_t = s, A_t = a \Big]
\end{aligned}
$$

Bellman equation: Random environments

Q-function optimality

$$Q_*(s,a) = \mathbb{E}\Big[R_{t+1} + \gamma \max_{a'} Q_*(S_{t+1}, a') \mid S_t = s, A_t = a\Big]$$

Comment on Q-learning

- Q-learning is an example of *temporal difference (TD) learning*
- It is an "off-policy" approach that is practical if the space of actions is small
- Value iteration is analogous approach for learning the value function for a given policy π, a (possibly random) choice of action for each state

Deep reinforcement learning: Motivation

- Direct implementation of Q-learning only possible for small state and action spaces
- For large state spaces we need to map states to “features”
- Deep RL uses a multilayer neural network to learn these features and the Q-function

Starting point: Bellman equation

$$Q(s, a; \theta) = \mathbb{E}\Big[R_{t+1} + \gamma \max_{a'} Q(S_{t+1}, a'; \theta) \mid S_t = s, A_t = a\Big]$$

- The parameters θ are weights in a neural network
- The state S_{t+1} is the input to the network
- Each possible action a is assigned a value by the network

How do we solve this implicit equation for the network parameters?

Strategy

Objective:

$$Q(s, a; \theta) = \mathbb{E}\Big[R_{t+1} + \gamma \max_{a'} Q(S_{t+1}, a'; \theta) \mid S_t = s, A_t = a\Big]$$

Let y_t be a sample from this conditional distribution:

$$y_t = R_{t+1} + \gamma \max_{a'} Q(S_{t+1}, a'; \theta_{\text{current}})$$

Adjust the parameters θ to make the squared error small (SGD):

$$(y_t - Q(s, a; \theta))^2$$

Strategy

Adjust the parameters θ to make the squared error small

$$(y_t - Q(s, a; \theta))^2$$

How? Carry out SGD

$$\theta \longleftarrow \theta + \eta \left(y_t - Q(s, a; \theta)\right) \nabla_\theta Q(s, a; \theta)$$

using backpropagation!

When does learning take place?

Recall from Bellman equation that y_t is an expectation.

Learning takes place when expectations are violated. The receipt of the reward itself does not cause changes.

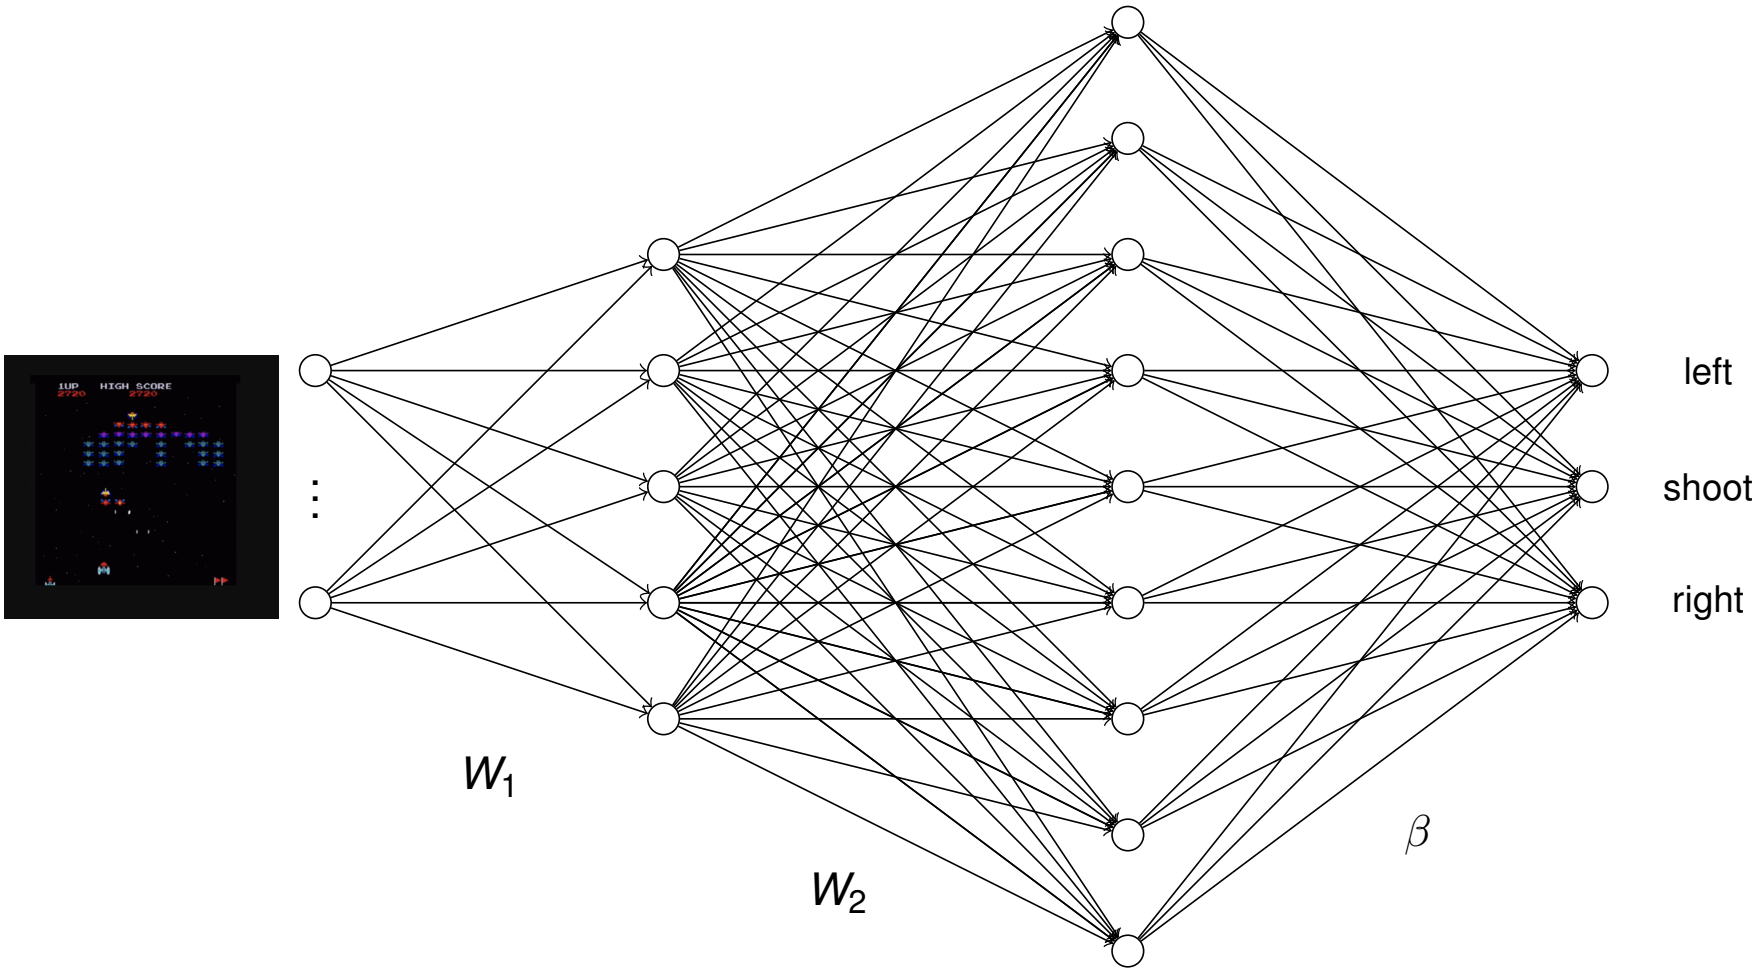
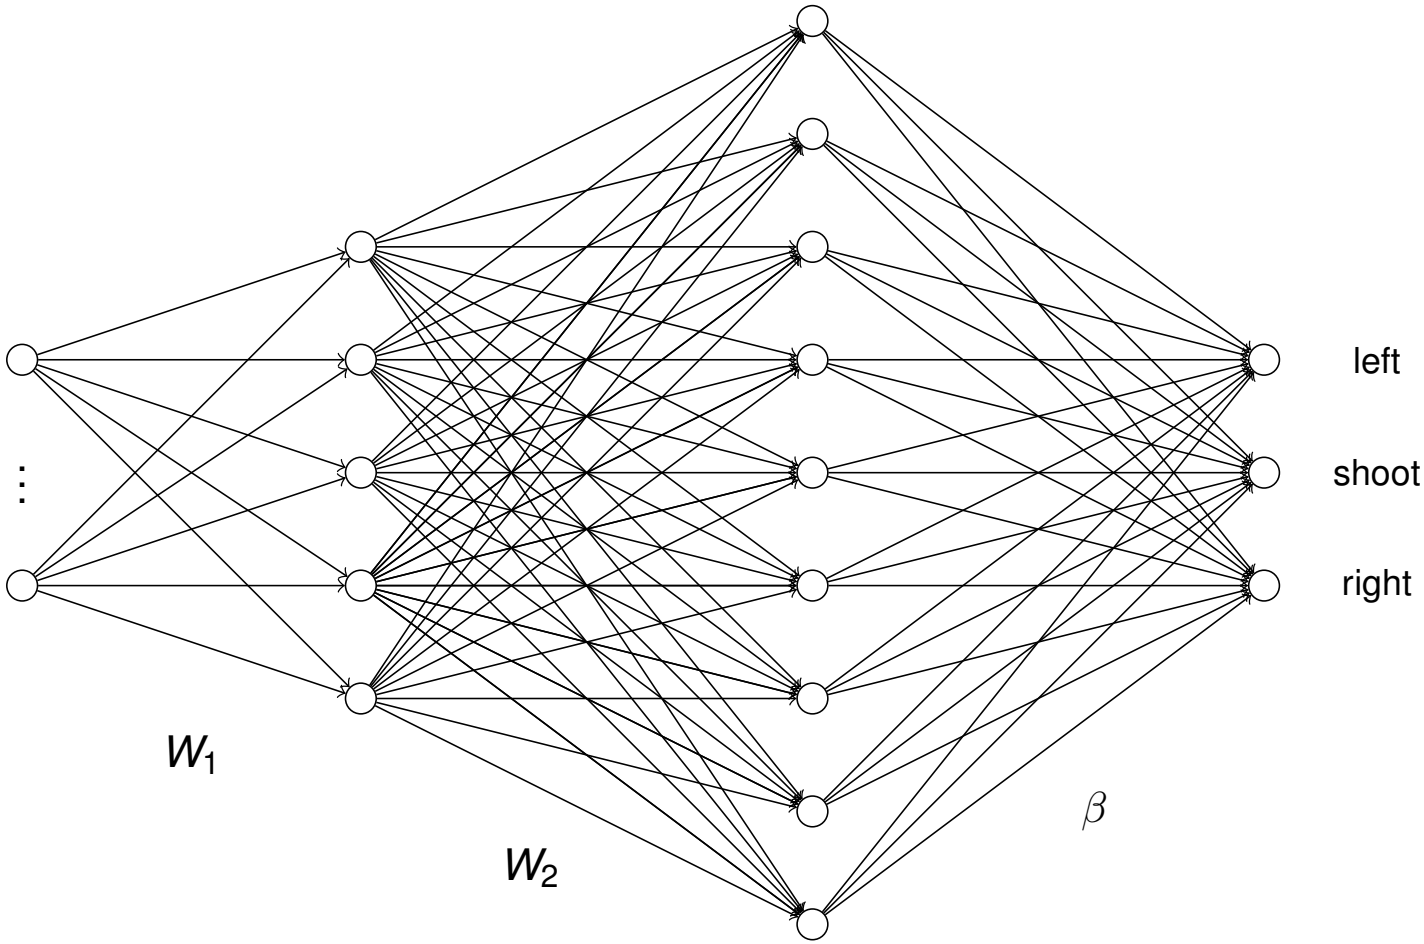
Space Invaders

Space Invaders: Q-learning framework



Space Invaders: Q-learning framework

(multiple frames)



DeepMind work

- Images cropped to 84 $\times$ 84 pixels; 128 color palette; input sequence of 4 frames; reward is score
- 3-layer convolutional neural network, ReLU nonlinearity, final layer fully connected, 256 neurons
- *Q*-learning carried out over minibatches of playing sequences that are "remembered and replayed"

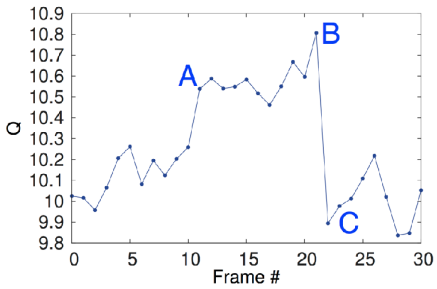
"Playing Atari with Deep Reinforcement Learning," Mnih et al., DeepMind Technologies, 2013. Larger versions reached human level performance on 29/49 games. Google acquired DeepMind and used Deep *Q*-learning to save energy (and money) in data centers.

DeepMind work

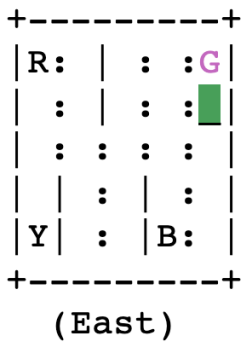
- Identical architecture used for seven games (Beam Rider, Breakout, Enduro, Pong, Q*bert, Seaquest, Space Invaders)
- Each game trained for 100 epochs (50,000 minibatch weight updates / epoch), about 50 hours
- Surpasses human expert on three of seven games

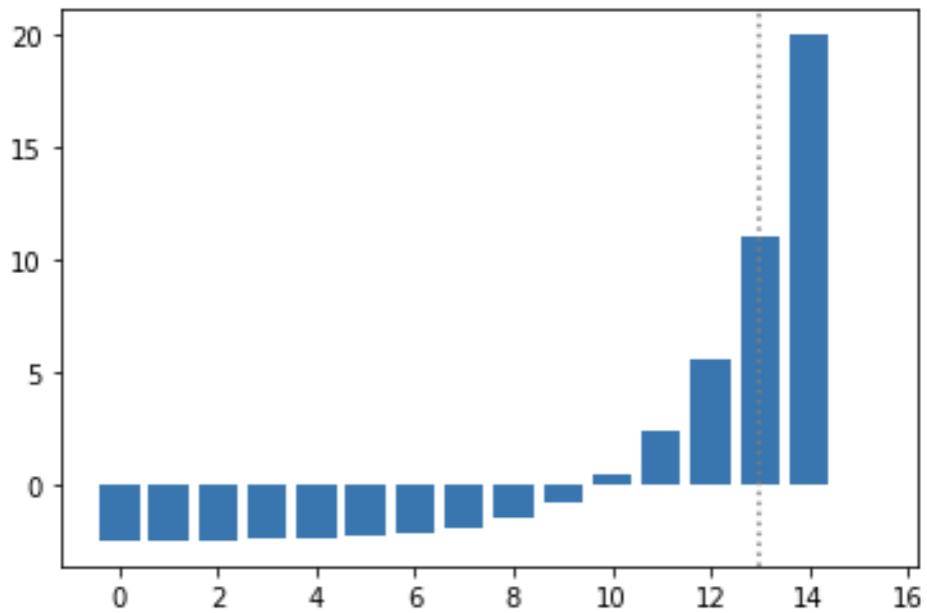
"Playing Atari with Deep Reinforcement Learning," Mnih et al., DeepMind Technologies, 2013. Larger versions reached human level performance on 29/49 games. Google acquired DeepMind and used Deep *Q*-learning to save energy (and money) in data centers.

Visualizing value function



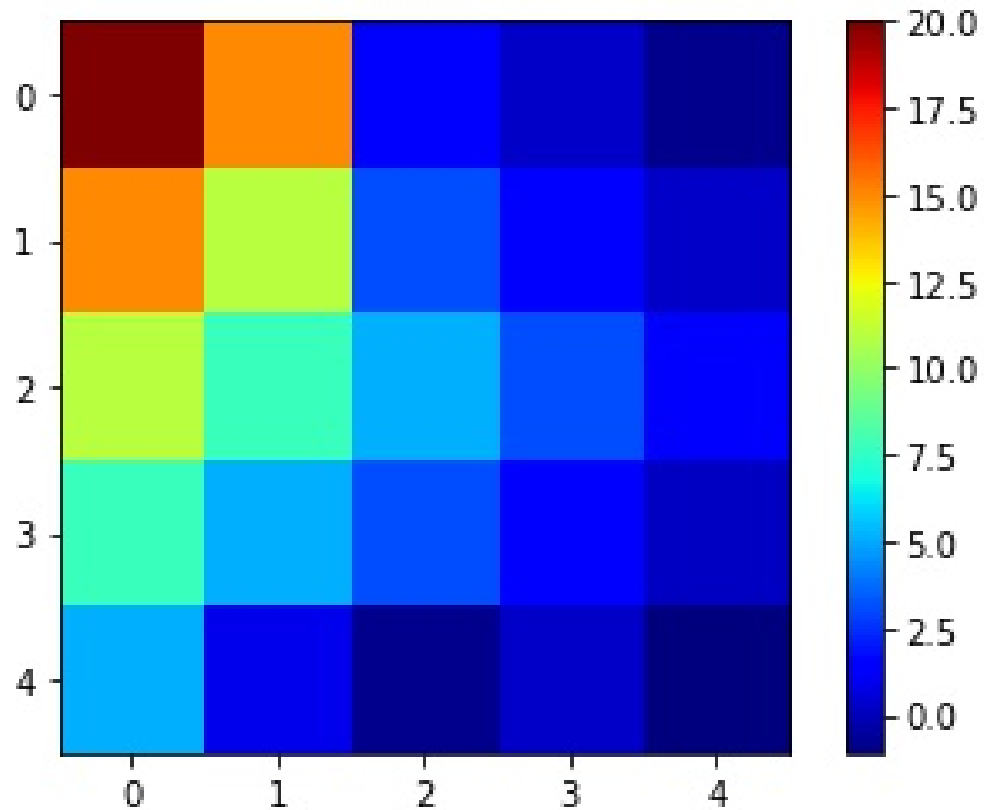
Visualizing value function: Taxi





Question

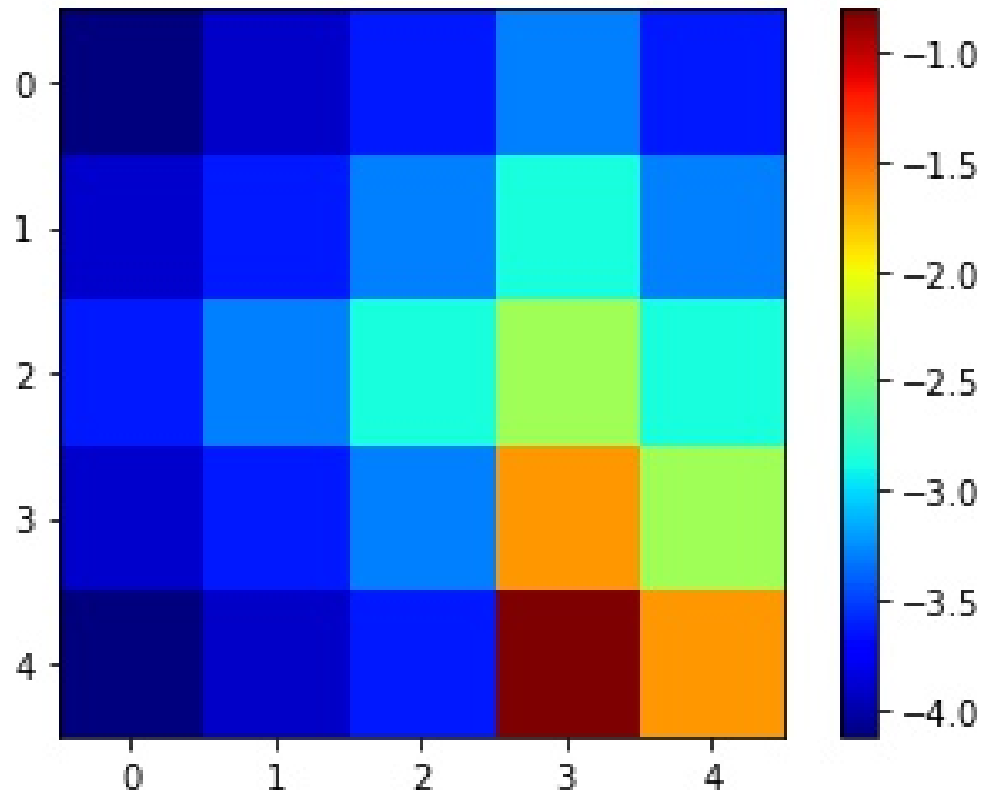
For a fixed passenger location and destination, the value function $v(\texttt{row}, \texttt{col})$ assigns a value to each of the $25 = 5 \times 5$ grid points.



Is the passenger waiting, or in the taxi?

Question

For a fixed passenger location and destination, the value function $v(\texttt{row}, \texttt{col})$ assigns a value to each of the $25 = 5 \times 5$ grid points.



Is the passenger waiting, or in the taxi?

Second generation DQN

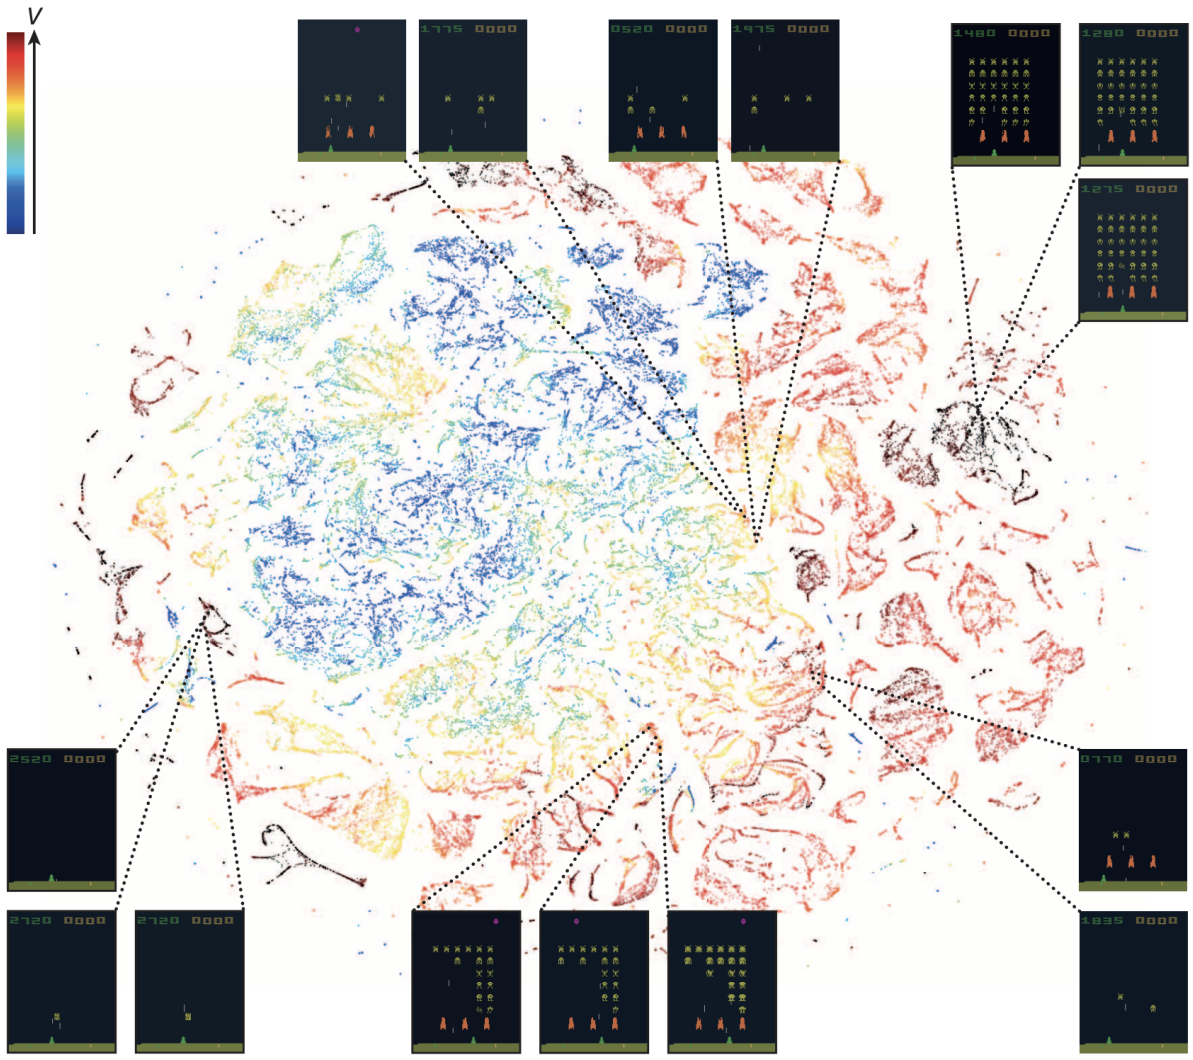
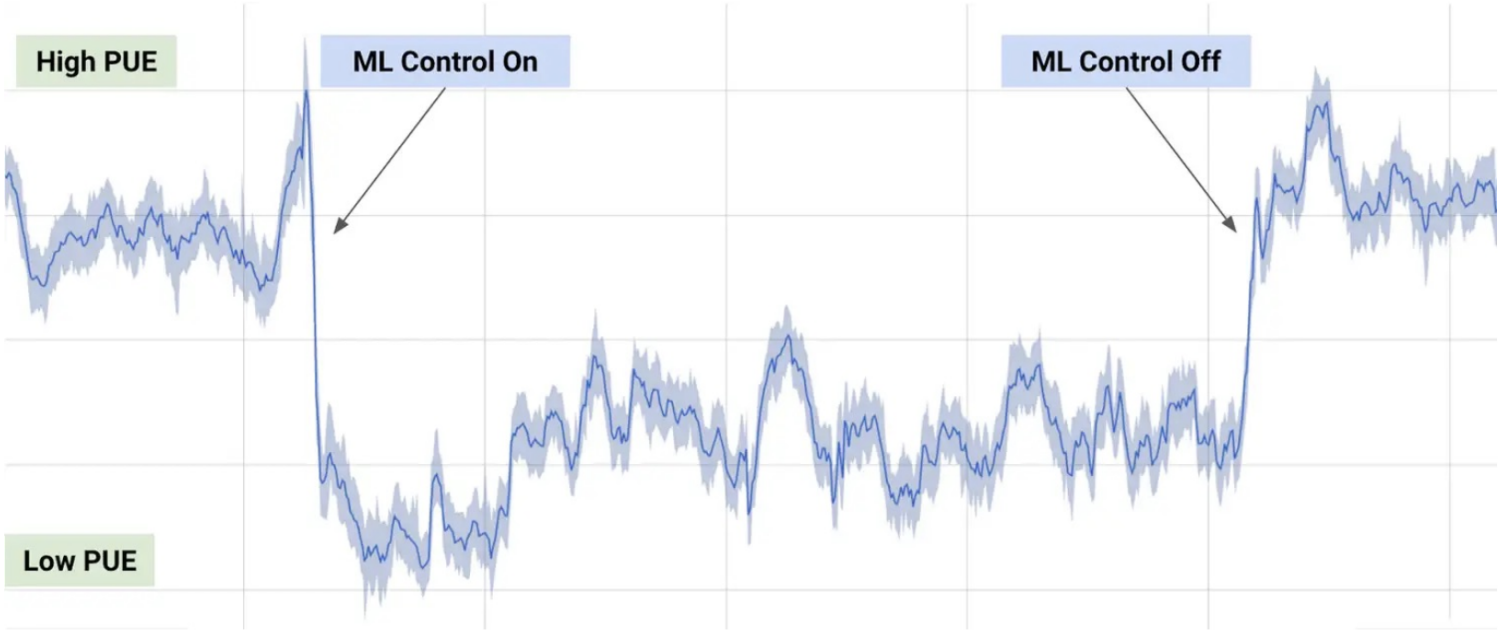
Second generation DQN: Interpretation



t-SNE represenations of last layer for Space Invaders, color-coded for v_*.

Payoff



Our machine learning system was able to consistently achieve a 40 percent reduction in the amount of energy used for cooling, which equates to a 15 percent reduction in overall PUE overhead after accounting for electrical losses and other non-cooling inefficiencies. It also produced the lowest PUE the site had ever seen.

Neuroscience connection

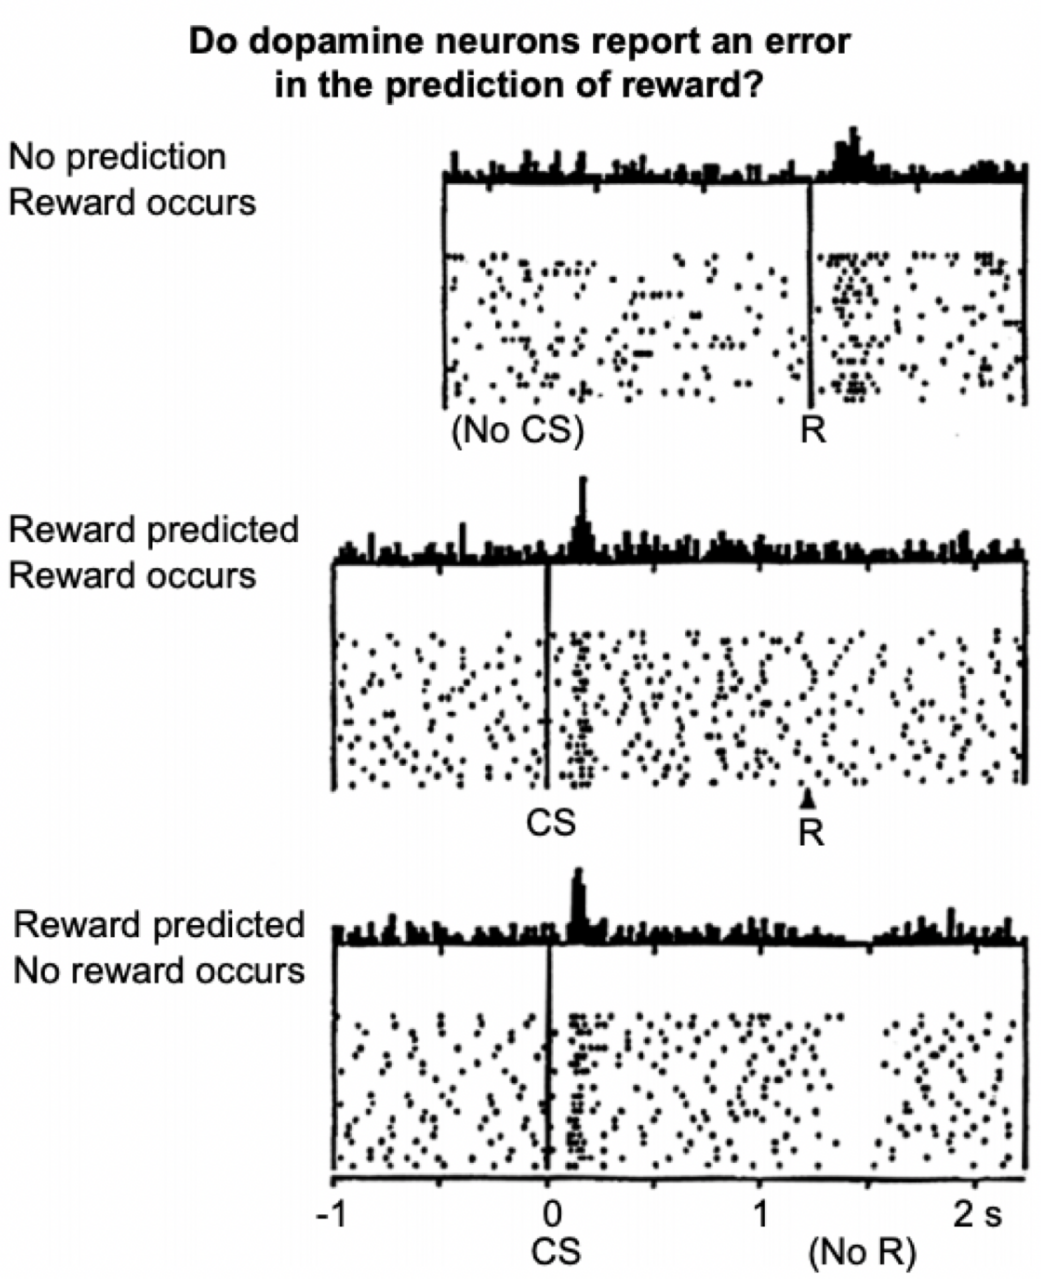
A Neural Substrate of Prediction and Reward

Wolfram Schultz, Peter Dayan, P. Read Montague*

The capacity to predict future events permits a creature to detect, model, and manipulate the causal structure of its interactions with its environment. Behavioral experiments suggest that learning is driven by changes in the expectations about future salient events such as rewards and punishments. Physiological work has recently complemented these studies by identifying dopaminergic neurons in the primate whose fluctuating output apparently signals changes or errors in the predictions of future salient and rewarding events. Taken together, these findings can be understood through quantitative theories of adaptive optimizing control.

Science 1997

Neuroscience connection



Dopamine

- Dopamine neurons fire when there is an error — expectations are violated
- Initially they fire when a reward is received when none was expected
- When a light is flashed before the reward (conditioning stimulus CS), dopamine firing moves to the stimulus, as the animal learns the association
- When the reward is removed, an error in expectation results; dopamine is again released

Summary

- For large state spaces, can't estimate Q-function directly
- Deep Q-learning: Using a (deep) neural network with state as input, value assigned to each possible action
- Success at increasing number of applications, outside games
- Close connection to neuroscience of behavior and reward
